```python
# -*- coding: utf-8 -*-
"""
Training an image classifier
----------------------------
We will do the following steps in order:
1. Load and normalizing the MNIST training and test datasets using
   ``torchvision``
2. Define a SVM model
3. Define a loss function
4. Train the model on the training data
5. Test the model on the test data
1. Loading and normalizing MNIST
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
Using ``torchvision``, it’s extremely easy to load MNIST.
"""

```
########################################################################
# See `here <https://pytorch.org/docs/stable/notes/serialization.html>`_
# for more details on saving PyTorch models.
#
# 5. Test the model on the test data
# ^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
#
# We have trained the model for 2 passes over the training dataset.
# But we need to check if the model has learnt anything at all.
#
# We will check this by predicting the class label that the model
# outputs, and checking it against the ground-truth. If the prediction is
# correct, we add the sample to the list of correct predictions.
#
# Okay, first step. Let us display an image from the test set to get familiar.
```

```python
dataiter = iter(testloader)
images, labels = dataiter.next()
images, labels = images.to(pytorch_device), labels.to(pytorch_device)

# print images
imshow(torchvision.utils.make_grid(images))

print('GroundTruth: ', ' '.join('%5s' % classes[labels[j]] for j in␣
 ↪range(len(labels))))

########################################################################
# Okay, now let us see what the model thinks these examples above are:

outputs = model(images)

########################################################################
# The outputs are energies for the 10 classes.
# The higher the energy for a class, the more the model
# thinks that the image is of the particular class.
# So, let's get the index of the highest energy:
_, predicted = torch.max(outputs, 1)

print('Predicted: ', ' '.join('%5s' % classes[predicted[j]]
                              for j in range(len(labels))))

########################################################################
# The results seem pretty good.
#
# Let us look at how the model performs on the whole dataset.
